2024-05-07 EM-64870: Full backups have been failing for the past month with rclone_proc error

ts_guide_to_jira_link

Link: EM-64870: Full backups have been failing for the past month with rclone_proc error CLOSED

From the description:

```
Observed Behavior:
Full backups are failing with following error after some time compressing the large DB file:
AttributeError: 'backup' object has no attribute 'rclone_proc'

Config Backups are fine.

Expected Behavior:
Backups should succeed. There is space on the share and credentials are correct.

Summary of troubleshooting steps taken so far and the current status:
    We have increased the memory for the backup process to 4GB in silo.conf and that resulted in one successful full backup only
    Have recommended using Full Backup On DR option, but they cannot access DR at this time
    Have checked for stuck procs and found none
    Need Eng assistance to move forward
```

2024-04-29 EM-64688: Restoring a config backup from root-based DB to clientdbuder-based DB causes various errors related to "definer ('clientdbuser'@'%') does not exist"

ts_guide_to_jira_link

Link: EM-64688: (no code fix, doc must be reviewed) Restoring a config backup from root-based DB to clientdbuser-based DB causes various errors related to "definer ('clientdbuser'@'%') does not exist" DONE

From the description:

```
Observed Behavior: Applying a config backup from ROOT-based DB to a new CLIENTDBUSER-based DB results in various problems due to "clientdbuser" continuing to be "definer" in various DB locations
Expected Behavior: config backup is expected to be valid as long as the original and new system are using he same SL1 version
Summary of troubleshooting steps taken so far and the current status:
To start, the officially documented instructions for restoring a Config backup do not cover the situation where a ROOT-based DB is being restored to a new CLIENTDBUSER-based DB, but technically it
is expected to be supported and so from my POV that is a Documentation Defect that needs to be fixed.

After speaking with Eng in the slack chat below, we have confirmed the required steps to apply the config backup restore ""successfully"" -- but those steps are NOT enough to properly update the system
and cause issues in the DB so this ticket is being opened to:
1- Get the steps we already know about added to the official docs
and
2- Get an official response from engineering about the proper steps that should be used after the main config backup is restored (and also get those steps added to the docs)

Slack Chat:
```

```
```

2024-04-25 EM-64634: Unknown error in EM7 Core: Backup Agent caused exit status of 1

ts_guide_to_jira_link

Link: EM-64634: Unknown error in EM7 Core: Backup Agent caused exit status of 1 CLOSED

From the description:

```
Observed Behavior: Backups failing due to unknown error.
Expected Behavior: Backups should be running succesfully.
Summary of troubleshooting steps taken so far and the current status:
The customer originally reported that backups were failing due to insufficient space in the SMB share. After working with the customer, we freed up space which resolved that issue. However, since
doing that, the backups have been inconsistent. They sometimes work and sometimes don't. To try to solve the issue, the customer removed all other data from the SMB share and now the backup is
failing consistently with the error "Unknown error in EM7 Core: Backup Agent caused exit status of 1" and "Backup Process already running, not starting, proc name EM7 Core: Bakup Agent, proc id 139".
What is weird is that we get this error despite there being no current backup process running. Collected debug logs but was unable to find any reason for these failures. Requesting assistance from
engineering to troubleshoot these errors and find a resolution.
```

2024-04-16 EM-64455: All backups Unable to backup: Error 2 backing up insight_agent

ts_guide_to_jira_link

Link: EM-64455: All backups Unable to backup: Error 2 backing up insight_agent CLOSED

From the description:

```
Which troubleshooting doc(s) were reviewed:
https://sciencelogic.atlassian.net/wiki/spaces/ENG/pages/28963209217/Backups
https://sciencelogic.atlassian.net/browse/EM-51123

Customer Timezone: est

Observed Behavior: All backups Unable to backup: Error 2 backing up insight_agent

Expected Behavior: backups to complete

Summary of troubleshooting steps taken so far and the current status:
Error:
2024-04-16T18:16:14.683145+00:00 localhost silo.backup.139[32606]: INFO backup_partial.main 233 Beginning configuration backup

```

2024-04-08 EM-64195: Full Backup size increasing abnormally everyday

ts_guide_to_jira_link

Link: EM-64195: Full Backup size increasing abnormally everyday CLOSED

From the description:

```
Observed Behavior: Full Backup size is increasing ~15G everyday for past 2 weeks
Expected Behavior: Full Backup size should not increase everyday if there are no new devices onboraded
Summary of troubleshooting steps taken so far and the current status:
    Verified Pruning is completing fine Daily and Hourly maintenance process
    Innodb size is not increasing as the backup size
    SMB backup is configured with default compression enabled "-k -1 -p4"
    Advised to change the compression "-k -6 -p4" which slow down the backup time but the spike is still there
    We disabled the silo_metrics table on the DB and truncated the silo_metrics data still the same
    Recently Cisco upgraded their custom PP on 15th March, not sure if this would cause sudden spike
```

2024-03-22 EM-63941 Full and Config Backups are failing after SL1 Upgrade to 12.1.1

ts_guide_to_jira_link

Link: EM-63941: Full and Config Backups are failing after SL1 Upgrade to 12.1.1 CLOSED

From the description:

```
Observed Behavior: Ever since upgrading their platform to 12.1.1. Backups have stopped. Both config and full
Expected Behavior: Backups should complete without issue.
Summary of troubleshooting steps taken so far and the current status:
    Enabled Debug Logging
    Can see from the logs that the filesystem is mounting without issue

ConfigurationBackupError: Error 2 backing up insight_agent

    Error seen from the full backup

2024-02-24T23:54:07.958749+00:00 localhost silo.backup.139[10526]: ERROR backup_partial.run_backup 867
Traceback (most recent call last):
File "/opt/em7/backend/silo_db/backup_partial.py", line 833, in run_backup
File "/opt/em7/backend/silo_db/backup_partial.py", line 410, in _exit_handler
AttributeError: 'backup' object has no attribute 'rclone_proc'

    Based on the error for 'rclone_proc', even though this is not Azure or AWS, it's a Windows device, I followed KB 10987 which asked to increase the Mem Limit for the backup process to 4GB. This did not fix the issue.
```

@Shawn Butts made a comment below about this error:

```
AttributeError: 'backup' object has no attribute 'rclone_proc' is a known bug that will be fixed in a later version.  It has nothing to do with rclone and only happens on non-rclone backups.  Unfortunately, it hides the underlining error.
```

2024-03-04 EM-63613 Requesting assistance to troubleshoot SL1 backups to S3 bucket in AWS

ts_guide_to_jira_link

Link: EM-63613: Requesting assistance to troubleshoot SL1 backups to S3 bucket in AWS

CLOSED

From the description:

```
Summary of troubleshooting steps taken so far and the current status:

Removed folder as a target for the S3 bucket. Verified that another S3 client can connect, read, and write to bucket.
==========================================================================================
SL1 backups are not reaching an S3 bucket in AWS.
Attempting to use the Create S3backup credential.
We are running version 12.1.1 on OL8
```
