Introduction

Diagnosis and Mitigation

Theory

clickpath: devices

This page is the ap2 device registry. The classic device registry is reached via devices → device_manager.

Post Mortem Articles

2024-07-30 EM-66190: Bulk Device deletion not working as expected (Classic UI)

ts_guide_to_jira_link

Link: EM-66190: Bulk Device deletion failing or taking forever at times, because of async config push step CLOSED

From the description:

```
Observed Behavior: Bulk deletion of the device doesn’t work properly

Expected Behavior: Device deletion should work

Summary of troubleshooting steps taken so far and the current status:
Datacom reached out stating that:
    ““We are facing issues while trying to delete devices from SL1. On doing so, the screen gets stuck on "Begin deletion" forever. Sometimes the devices are actually deleted although the screen is stuck
    and we have also noticed that if multiple devices are selected, the deletion happens in batches while a few don't get deleted at all””

I went on the call to observe this behaviour.
Trying to delete the component device and the root device associated with the component device is already removed.
We can see that no relationship exists:
We tried to delete the component device but the UI gets stuck here:
However, shortly after sometime it got updated:
We can see that this time the device got deleted properly this time but it says config push got failed.
Customer mentioned that they are facing this issue for the devices which are associated with the same collector.
Tried deleting another device 102422:
Here the devive got deleted after confirming the same from Device manager page but no logs populated in the UI.
Hence we enabled php-devlogs and now trying to delete another device 102424:
    00451865 (2).zip
    30 Jul 2024, 03:17 AM

In the php logs I can see the deletion is executed:
    Line 1167190: 14:59:45.35878|*/em7/phpshare/classes/maint/device_deleter.inc:delete|99|debug|device_deleter.delete: Enter - device(s) to delete: 102424; setting cug_id and pid to 0 in master_dev.legend_device

Now the issue here is datacom is saying that when they try to delete devices in bulk i.e. 8 to 10 devices some devices get deleted and some don’t
I tried to gather information about config push process on their DB:
I asked datacom team to enable debug mode for config push but they mentioned they have DB issues and they can’t enable debug mode

Questions:
How we can confirm if the device deletion is taking properly if the UI logs are not populating in the pop-up window.
The Device deletion UI logs issue is intermittent, any reason why this could be happening? Is it getting timed-out?
```

2024-07-24 EM-66098: CPU Thresholds changing option are not showing for some of the Linux device Thresholds page

ts_guide_to_jira_link

Link: EM-66098: CPU Thresholds changing option are not showing for some of the Linux device Thresholds page CLOSED

From the description:

```
Observed Behavior: we can see the DA is collecting the logs without issue but the threshold Tab is not showing the CPU performance threshold

Expected Behavior: It should be showing the threshold information of the DA in threshold Tab

Summary of troubleshooting steps taken so far and the current status:
Verified he DA collection
verified the DA threshold configuration.

2024-06-14 EM-65450: Unable to update device IP

ts_guide_to_jira_link

Link: EM-65450: Unable to update device IP in device properties page CLOSED

From the description:

```
Observed Behavior: The customer has devices where they changed the IP of the device and when trying to update the admin/primary IP address on the device in SL1 the IP keeps reverting to the old IP address
```

```
Expected Behavior: SL1 should allow you to  change the IP of a device after the device IP was changed on the device.

Summary of troubleshooting steps taken so far and the current status:

    I have verified with the customer that the new IP is listed in the IP list of the device when the new IP is selected and they save the device properties SL1 will set the IP of the device to the
    new IP but after a few minutes ~5 the device IP changes back to the old IP address.

    The device has a host name of an IP address (We have not been able to find out how the device got an hostname of an IP address).

    I did an nslookup of the device hostname from the collector and it returns the new IP address.

    I did an reverse nslookup using the old IP and it is not found so it is not a DNS lookup issue.

    If the customer removed the hostname from the device then the IP address can be changed and it will not revert back to the old IP address

I was ale to reproduce this in a lab.

Lab 10.64.70.129 default em7admin creds.
Device ID 9 Ip was originally 10.64.70.192
I changed the IP of the device in simplesoft to 10.64.70.205
I added IP 10.64.70.205 to the device, selected it as the admin/primary Ip of the device.
After about 5 minutes the IP will revert back to 10.64.70.192
```

2024-04-05: EM-64192: SL1 UI IP Address Sorting Issue

ts_guide_to_jira_link

Link: 💔SLUI-20545: SL1 UI IP Address Sorting Issue CLOSED

From the description:

```
Observed Behavior: IP addresses are sorted alphabetically
Expected Behavior: IP addresses are sorted numerically
Summary of troubleshooting steps taken so far and the current status:
    Confirmed this happens in 12.2.0 as well
    Checked on DSU to see if anyone in support had heard of this being reported before, as I'm surprised this is just being noticed now - apparently it has not been seen before
    On DSU Leo pulled the query the UI is using and provided an updated query that appears to work as expected. Both are noted internally in a previous SF update, will include those on the Jira right after creation so
    that I can properly use code blocks. Will also include a better explanation of the issue with that example.

Current query(I modified the limit and included the output from test lab):
MariaDB [(none)]> SELECT ld.device, dst.state, ld.id, cdm.root_did, cdm.parent_did, ld.ip, dcl.family, dca.cat_name, dcl.class, dcl.descript, o.company, ld.cug_id, ld.active, ld.snmp_cred_id, scs.snmp_version, ld.roa_id,
ld.iid FROM master_dev.legend_device ld LEFT JOIN master_biz.organizations o  ON (ld.roa_id = o.roa_id) LEFT JOIN master_dev.device_state dst  ON (dst.did = ld.id) LEFT JOIN master.definitions_dev_classes dcl
```

```
ON (ld.class_type = dcl.class_type) LEFT JOIN master.definitions_dev_cats dca  ON (dca.Fid=dcl.family) LEFT JOIN master_dev.component_dev_map cdm  ON (cdm.component_did=ld.id) LEFT JOIN master.system_credentials sc
ON (sc.cred_id=ld.snmp_cred_id) LEFT JOIN master.system_credentials_snmp scs  ON (sc.cred_id=scs.cred_id) INNER JOIN master.system_collector_groups scg  ON (scg.cug_id = ld.cug_id) WHERE 1 ORDER BY ip DESC, device ASC LIMIT 5;

| 10.64.71.12 |     0 |  806 |     NULL |       NULL | 10.64.71.12  |     32 | Pingable   | Ping              | ICMP               | System  |     12 |      1 |            0 |    NULL |      0 |   0 |
+-------------+-------+------+----------+------------+--------------+--------+------------+-------------------+--------------------+---------+--------+--------+--------------+---------+--------+-----+
5 rows in set (0.007 sec)

Note that ORDER BY ip DESC - 10.64.71.189 is a higher IP than 10.64.71.70. The .189 IP should be the first in the result, then the .70, then .14 etc.
```

2024-03-12: EM-63732: Subscriber Page [System→Manage→Applications→Subscribers] Timeout 504 Gateway Issue

ts_guide_to_jira_link

Link: 💔EM-63732: Subscriber Page [System→Manage→Applications→Subscribers] Timeout 504 Gateway Issue CLOSED

From the description:

```
Mindtree are experiencing issues where the Subscriber Page [System->Manage->Applications->Subscribers] keeps timing out on them with the error '504 Gateway Timeout', which is addressed in this kb: https://support.sciencelogic.com/s/article/1269.
Both the timeout, and the memory limit have been increased to 5 minutes and to 1gb respectively, which has helped it to load some of the time however it didn't completely resolve the issue.
I could find that this page has been problematic in the past and the efficiency was improved: https://sciencelogic.atlassian.net/browse/EM-27066, but with Mindtree being one
```

```
of the largest single platforms with 22k+ active devices, I believe it is causing the page to hit it's limits.
The query looks to search through every device, where on this there are 22k+ active, and 110k+ altogether.
They have been recommend in the past to reduce the number of devices, however they say this can’t be done due to the way the VMware PP operates.
Running the command
silo_mysql -Be "show full processlist;" | grep -v Sleep | sort -nk6

There appeared to be a a query that looks to fit the bill:
| 2024-03-11 14:40:50.423988 | clientdbuser[clientdbuser] @  [10.241.113.48]  | 00:05:02.630466 | 00:00:00.031066 |         0 |      19758536 | master |              0 | 0 | 1535504938 | SELECT did, presentation_id
FROM master.V_dynamic_app_device_presentations
WHERE app_id = '' AND collect = '1' AND found = '1'
GROUP BY did, presentation_id

Manually running this on the db takes excessive amount of time to run too.
```

2024-02-19 EM-63393: Linux CPU Performance DA aligned to are not showing CPU threshold in threshold Tab

ts_guide_to_jira_link

Link: 💔EM-63393: Linux CPU Performance DA aligned to are not showing CPU threshold in threshold Tab CLOSED

From the description:

```
Observed Behavior:  we can see the DA is collecting the logs without issue but the threshold Tab is not showing the CPU performance threshold

Expected Behavior:  It should be showing the threshold information of the DA in threshold Tab

Summary of troubleshooting steps taken so far and the current status:
provided in https://sciencelogic.atlassian.net/browse/EM-60453. Also tried deleting the old CUG and creating a new CUG. Onboarded the devices but the Filesystem was discovered and added to the threshold tab but the CPU performance
thresholds is not displaying in the threshold tab. Tried restarting the collector, Re-adding the DA.

2024-01-02 EM-63688: Users are unable to disable component devices

ts_guide_to_jira_link

Link: 💔EM-63688: Users are unable to disable component devices CLOSED

From the description:

```
Observed Behavior: The users are unable to disable the component devices from SL1 classic UI.

Expected Behavior: They should be able to disable the component devices.

Summary of troubleshooting steps taken so far and the current status:

checked the access hooks aligned to the access key.
cleared the SL1 and browser cache.
restarted php-fpm,nginx services.
customer tried deleting the user and tried as a recreating the user.
while checking with administrative account it works.
when the user tries to disable the device. We are not seeing any error just the "Loading..." text in the screen. Tested with DID 27040 and 27038
```
