## Introduction

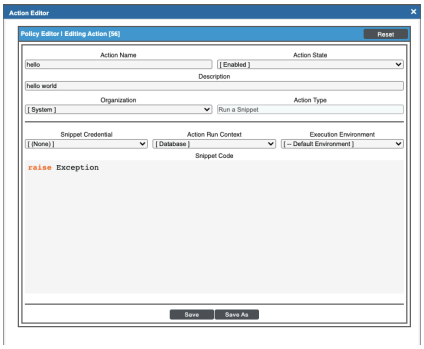
Run book actions tied with automations are a key part in the extensibility of our platform.

## Diagnosis and Mitigation

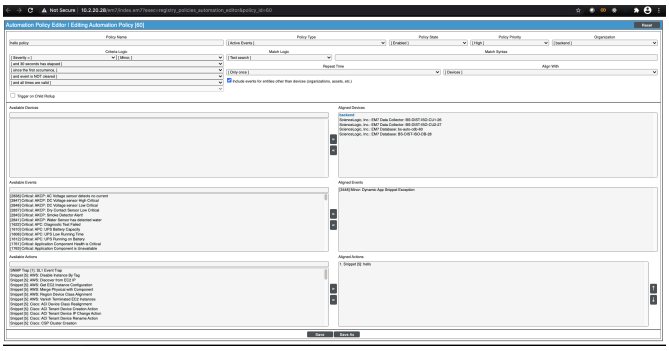
### Action Not Firing with Automation Policy

- Make sure you have a device selected
- An event selected
- An action aligned
- Action selected needs to be enabled
- Automation policy needs to be enabled
- Action context, make note of where you want this to run - CU or CDB
- Make a note of where you want this action to run, whether on the collector or the CDB.
- Automation Policy: Definitely Definitely make note of the **ORGANIZATION** you choose. The classic UI lets you align a device in an org but won't fire if you don't specify the org for that device.

### Action



### Automation Policy



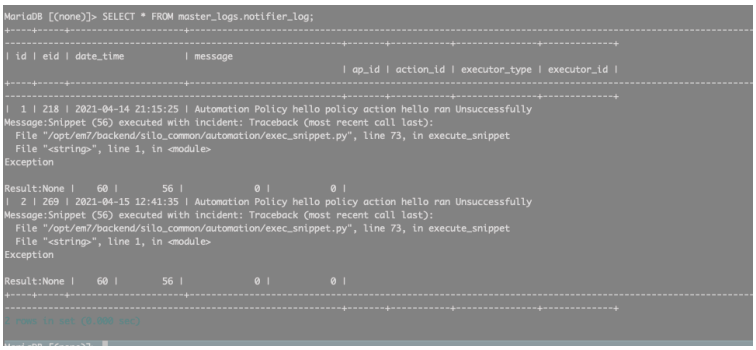
One of the first things you can do to see if your action is firing is by looking at the notifier log. Example

```
SELECT * FROM master_logs.notifier_log;
```

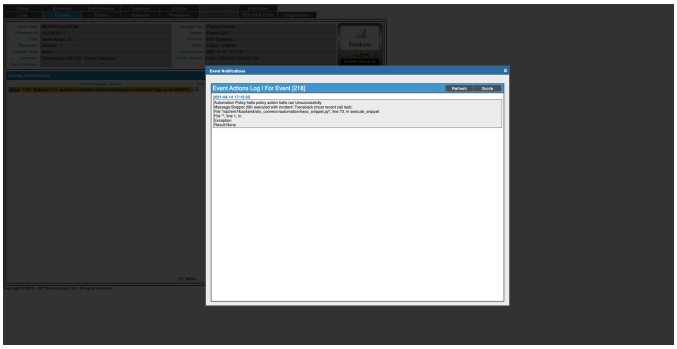
You can also pass in an event ID like such when tied to an event.

```
SELECT * FROM master_logs.notifier_log mlnl WHERE mlnl.eid = <event_id>;
```

CDB Notifier Log



You can also look at the notifier logs in the UI by going to the device summary icon, clicking on the events tab for a device, and then clicking on the envelope icon for an event



Action Marked As Success When False
