2024-07-11 EM-65821: ATT SL1 POV Sigterms for WLC collection

ts_guide_to_jira_link

Link: SOL-27758: ATT SL1 POV Sigterms for WLC collection CLOSED

From the description:

```
Observed Behavior:
```

```
Nightly Update process sigterms seemingly due to high number of UHEs generated by Cisco WLC DA's

Expected Behavior:
Nightly update should succeed. So should Cisco WLC collections

Summary of troubleshooting steps taken so far and the current status:
(Support Engineers need to provide a detailed summary of what steps have been taken so far and where they are currently at with the issue.)
We ran the sigterm script (results attached) and it flagged issues but of note was the affinity issues. Many of the Cisco WLC DAs are listed as having affinity issues. But this stack has one
cug which one collector that is assigned to all WLC collections. So I don't see how there could be an affinity issue.
We also looked at the UHEs for those Dynamic applications. They seem to happen consistently throughtout the day however, I can't rule out that the UHEs are causing Nightly Update to overrun it's scheduled time and fail.
```

2024-06-05 EM-65291: Cisco APs fail over to different WLC successfully but create an availability alert

ts_guide_to_jira_link

Link: SOL-27303: Cisco APs fail over to different WLC successfully but create an availability alert CLOSED

From the description:

```
Observed Behavior:
When an AP fails over, there is an availablility alert that is generated for it despite the ap still being available. IT then discovers a duplicate device which reuqires cleanup

Expected Behavior:
SHould not create an alert nor a duplicate device. The alert is the bigger deal to the customer.

Summary of troubleshooting steps taken so far and the current status:
WE looked at https://support.sciencelogic.com/s/article/6646 but that seems to be almost the opposite behavior to what the customer is seeing. Documentation (public and internal) don't seem to explicitly answer the question as to whether this is expected behavior or not. But this is inflating Insight's customers' numbers on the number of alerts in those customers' environements.
```

2024-04-24 EM-64616: Cloud System Devices Appearing in Cisco: Wireless DCM Tree

ts_guide_to_jira_link

Link: SOL-27315: Cloud System Devices Appearing in Cisco: Wireless DCM Tree CLOSED

From the description:

```
Observed Behavior: Cloud System devices appearing in the Cisco WLC DCM tree when those devices do not exist in the WLC app.
Expected Behavior: The DCM tree should only contain the APs that exist in the WLC being monitored.
Summary of troubleshooting steps taken so far and the current status:
```

```
Customer reports that there are devices appearing under the wireless controller root device that are listed as Cloud System devices, however these devices do not appear in the AP list and e cannot determine how these devices are
getting discovered. We enabled vanishing devices and removed the Cloud System devices manually, however, they always return. These devices do not appear when running the Cisco: WLC AP Discovery app in debug mode and there is no
other discovery app aligned to the root device that I can tell. Requesting assistance from the engineering to determine where these devices are coming from and how to stop them from appearing in the DCM tree.
```
