ServiceNow FAQ

This page covers frequently asked questions for troubleshooting common ServiceNow issues.

For Integration Service-related FAQs, see the link here.

For the parent Troubleshooting Guide landing page, see the PowerFlow and ServiceNow Troubleshooting Guide .

- I'm getting a 500 Internal Server Error when syncing Incidents to ServiceNow. What should I do after verifying version info?
- Incident numbers not populated in EM7 on Incident creation in ServiceNow
- I'm not getting Incidents in ServiceNow. What do I do?
- My Incident doesn't have a CI
- UI Down - INC's no longer Generating:
- Egad! I keep getting blank incidents in ServiceNow! Why?!
- I can't figure out how to create new attribute mappings to save my life! What's the trick?
- I've added new device classes and mapped them in the Device Sync app configuration, but they're not syncing. WHY NOT?!

I'm getting a 500 Internal Server Error when syncing Incidents to ServiceNow. What should I do after verifying version info?

First, run the application in debug mode. To set Incident sync in debug, set debug to True in the Run Book Action. Make sure to set debug back to false afterwards or it may result in further issues.

After running in debug, grab the debug logs for the failed step. You should see a 500 internal server error and the payload that is being sent to ServiceNow.

Pull out the payload and format it correctly. Use Postman and post to the following API endpoint with the event payload data.

{snow_hostname}/api/now/import/x_sclo_scilogic_incident?sysparm_display_value=all&sysparm_exclude_reference_link=true&sysparm_input_display_value=true

Examine the response back from ServiceNow and see whether an INC ID is returned in the response.

If the ServiceNow response works using Postman, there is something misconfigured on PF.

If the ServiceNow response does not work using Postman, there is something misconfigured on ServiceNow.

Incident numbers not populated in EM7 on Incident creation in ServiceNow

https://sciencelogic.slack.com/archives/CAJ7LMXSS/p1540318098000100

If incident exists in ServiceNow, but incident data isn't getting back to SL1, and the "Sync ServiceNow Incident State to ScienceLogic Event" app is failing on the "Get Incident" step with a 404 error and eventually times out after retries are maxed out, it cold be due to the ServiceNow API being overloaded.

I'm not getting Incidents in ServiceNow. What do I do?

1. First, check the mailbox icon in SL1 for the event that was created.
2. Verify that the RBA was triggered and that the RBA posted to Integration Service successfully.
3. Get the IS Application ID for that run of the "Create or Update ServiceNow Incident from SL1 Event" to see where the application failed.
4. Look at the logs for that run of the IS application

My Incident doesn't have a CI

For an incident with an active event:

1. FIRST ensure that you have run the device sync application at least more than once. Run the device sync app at least twice.
2. Go to the notification log and get the IS run id
3. Pull up that app with that run and check the logs
4. Confirm that the device class is **mapped** in device sync
5. Confirm that device sync is running every 24h (minimum) and has run within 24h of that event sync run

You can confirm if the CI has been cached in PowerFlow by going to the CouchBase UI on port 8091 using a browser (login with isadmin credentials), and running the following query in the "Query" section:

```
select meta().*, * from logs where log_type == "cache" and meta().id like "lookup%12345%" limit 1
```

where "12345" is the DID of the device in question.

UI Down - INC's no longer Generating:

Problem: IS UI is unresponsive and Incidents are not being generated in ServiceNow.

Issue: During the deployment process, changing the firewall rules for monitoring breaks the ingress network for Docker.

Solution: **Restart docker after any firewall or network configuration change.**

systemctl restart docker

Reference: case: 00047447

Egad! I keep getting blank incidents in ServiceNow! Why?!

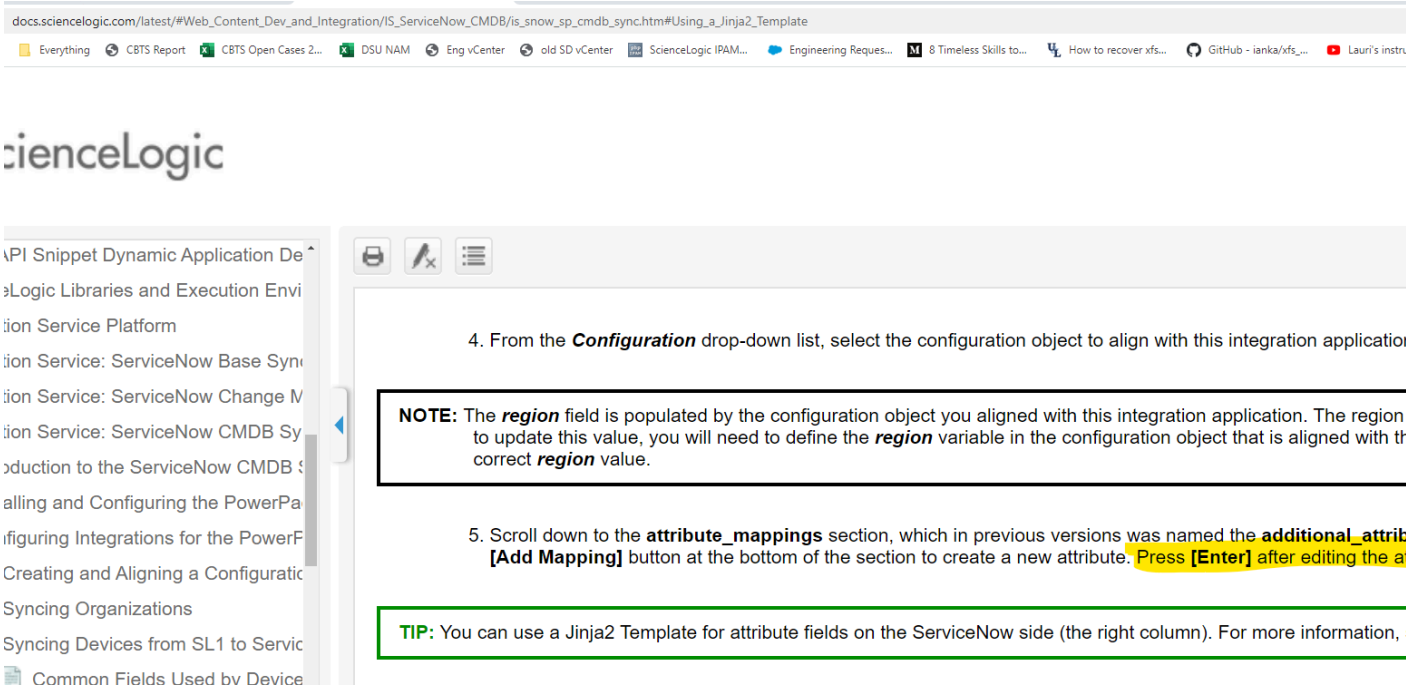
There was a bug in the update set that was not skipping incident creation when appropriate (e.g. cleared event action firing before active event action). EM-29559 - [Escalation] Blank incidents being created in SNOW DONE EM-27607 - [Escalation] Blank incidents being created in ServiceNow by Integration Service 1.7.0 CLOSED

I can't figure out how to create new attribute mappings to save my life! What's the trick?

The fields on the left side and the right side of the attribute mapping act as filters for the available choices... Unless you hit the Enter key, in which case a new entry is created, and you are able to enable the checkbox for that entry to activate it.

This is not obvious to the end user, and so a defect was created in case 00099902 to address this.

Documentation describing the feature is here:
https://docs.sciencelogic.com/latest/#Web_Content_Dev_and_Integration/IS_ServiceNow_CMDB/is_snow_sp_cmdb_sync.htm#Using_a_Jinja2_Template



This is the text that is in the documentation that tells us the importance of hitting the Enter key.

I've added new device classes and mapped them in the Device Sync app configuration, but they're not syncing. WHY NOT?!

There is a known issue where if there are multiple device classes with the same name, only one of the device class GUIDs is pulled to generate the GQL query that retrieves the devices from SL1 for comparison. This is fixed in ServiceNow SyncPack 3.1.0 and beyond. The workaround is to ensure that the device classes that you are mapping over have unique names.

Background discussed in #guild-is4 here: https://sciencelogic.slack.com/archives/CAJ7LMXSS/p1591124873467500?thread_ts=1591124620.466100&cid=CAJ7LMXSS
